

Appointment Status Flow

How an appointment moves from Scheduled to Completed or Missed

1. The flow in one picture

The main rule: **an appointment only becomes Missed if the patient and the doctor were never in the consultation together before the time ran out.** Once both have joined, time no longer matters - the appointment waits until the doctor saves the consultation.

2. When does an appointment become Missed?

Three things must happen:

#	Condition	Detail
1	Time is over	Cutoff = slot start + doctor's slot duration + buffer (from the doctor's Availability page; default 20 min + 0 min). Example: 10:00 + 20 + 5 = 10:25 .
2	Never together	Status is still scheduled, checked_in or rescheduled. An in_session, completed or cancelled appointment is never marked Missed.
3	A check runs	There is no background timer. The check runs when: the doctor opens the dashboard queue, the patient opens notifications, or someone tries to join the video after the cutoff. Whichever comes first marks it Missed and notifies the patient (once).

Note: the patient's Appointments page shows *Missed* as soon as the cutoff passes, even before a check runs. The notification and email are only sent when a check runs.

Who missed it? (missed_by)

Patient arrived?	Doctor arrived?	missed_by	Doctor sees	Patient sees
Yes	No	practitioner	You didn't join	Doctor didn't join
No	Yes	patient	Patient didn't join	You didn't join
No	No	both	No one joined	No one joined
Yes	Yes	never missed	-	-

'Arrived' means the person opened the video waiting room or video page (recorded in `patient_joined_at` / `practitioner_joined_at`). For a clinic visit, the doctor clicking **Consult** counts as both arrived; a clinic slot that was never started is saved as `missed_by` = patient.

3. Status lists

appointments.status (database enum appointment_status)

DB value	Doctor queue shows	Patient page shows	Meaning
scheduled	Waiting	Confirmed	Booked, nobody has arrived yet
rescheduled	Waiting	Confirmed	Same as scheduled
checked_in	Checked In	Confirmed	Only ONE person has arrived
in_session	In Session	In Session	BOTH arrived - can never become Missed
in_session + call ended	Awaiting Notes	Prescription Pending	Consultation done, doctor has not saved notes yet
completed	Completed	Completed	Doctor saved the consultation
no_show	Missed + reason	Missed + reason	Time over and they were never together
cancelled	(not shown)	Cancelled	Cancelled by patient or doctor

There is no 'missed' value in the database - Missed is stored as `no_show`. 'Awaiting Notes' is not stored either: it is shown when status is `in_session` and the call has ended (`video_status` = ended or `session_ended_at` is filled).

appointments.video_status (video appointments only)

Value	Meaning
not_started	Default - nobody has opened the video page
waiting	Someone opened the waiting room (the room was created)
in_progress	The doctor joined the video call
ended	The doctor left / ended the call (only once the patient has joined)
cancelled	The appointment was cancelled

appointments.missed_by (new column)

Value	Meaning
patient	The patient did not come (doctor came, or clinic slot never started)
practitioner	The doctor did not come (patient came)
both	Nobody came (video)
null	Not missed

4. Supabase fields written at each step

Step	Fields written
Booked	status = scheduled, video_status = not_started, scheduled_date, scheduled_time
First person arrives (video)	status = checked_in, patient_joined_at OR practitioner_joined_at, checked_in_at, video_room_name, video_status = waiting
Both arrived	status = in_session, both joined_at fields, session_started_at; video_status = in_progress when the doctor is in the call
Clinic: doctor clicks Consult	status = in_session, patient_joined_at, practitioner_joined_at, checked_in_at, session_started_at
Call ended (Awaiting Notes)	video_status = ended, session_ended_at, duration_min (status stays in_session)
Doctor saves (Completed)	appointments: status = completed (+ session_ended_at if empty). New rows in consultations (is_complete = true), emr_notes, prescriptions (status = finalized), prescription_items (none if 'No prescription needed')
Missed	appointments: status = no_show, missed_by, no_show_marked_at. notifications: one in-app row for the patient (reference_type = appointment) + email
Cancelled	status = cancelled, video_status = cancelled, cancelled_at, cancellation_reason

New columns (migration 20260929000000_appointment_attendance.sql)

Column	Type	Purpose
patient_joined_at	timestampz	When the patient first opened the video (or doctor started a clinic consult)
practitioner_joined_at	timestampz	When the doctor first opened the video (or started a clinic consult)
missed_by	text (check)	patient / practitioner / both - who did not show up

5. Scenarios

Example slot used below: **10:00 AM**, slot duration 20 min, buffer 5 min, so the cutoff is **10:25 AM**.

Scenario 1 - Normal video consultation, notes saved on time

- 1 Patient opens the waiting room at 9:58 - status becomes **checked_in**, patient_joined_at = 9:58.
- 2 Doctor clicks Start Video at 10:00 - both have arrived, status becomes **in_session**.
- 3 They talk; the doctor leaves the call at 10:15 - video_status = ended (queue shows **Awaiting Notes**).
- 4 Doctor fills medicines and clicks Save Consultation at 10:18 - status becomes **completed**.

Final DB status	Doctor sees	Patient sees
completed	Completed	Completed (Prescription link)

Scenario 2 - Both joined, doctor fills the prescription late

- 1 Both join at 10:00 - status **in_session**.
- 2 Call ends at 10:20. The cutoff (10:25) passes, but the doctor has not saved notes yet.
- 3 Queue keeps showing **Awaiting Notes** with an **Add Notes** button - even the next day. It is never marked Missed.
- 4 Doctor clicks Add Notes and saves (e.g. at 12:30) - status becomes **completed**.

Final DB status	Doctor sees	Patient sees
completed	Awaiting Notes, then Completed	Prescription Pending, then Completed

Scenario 3 - Consultation runs longer than the slot

- 1 Both join at 10:00 - status **in_session**.
- 2 The call is still going at 10:40, after the 10:25 cutoff.
- 3 Nothing changes: **in_session** can never become Missed. Queue shows **In Session** with Rejoin Video and Consult.
- 4 Call ends and the doctor saves - **completed** (same as Scenario 1 or 2).

Final DB status	Doctor sees	Patient sees
completed	In Session	In Session

Scenario 4 - Doctor came, patient did not

- 1 Doctor opens the video at 10:00 - status **checked_in**, practitioner_joined_at = 10:00.
- 2 Patient never opens it - patient_joined_at stays empty.
- 3 Doctor leaving the call does NOT close the room (the patient could still come).
- 4 Cutoff 10:25 passes. On the next check: status **no_show**, missed_by = **patient**. Patient gets an in-app notification and an email.

Final DB status	Doctor sees	Patient sees
no_show / patient	Missed - Patient didn't join	Missed - You didn't join

Scenario 5 - Patient came, doctor did not

- 1 Patient opens the waiting room at 9:58 - status **checked_in**, patient_joined_at = 9:58.
- 2 Doctor never opens the video.
- 3 Cutoff passes. On the next check: status **no_show**, missed_by = **practitioner**.
- 4 Patient notification/email says the doctor was unable to join (the patient is not blamed).

Final DB status	Doctor sees	Patient sees
no_show / practitioner	Missed - You didn't join	Missed - Doctor didn't join

Scenario 6 - Nobody joined (video)

- 1 Neither side opens the video page. Status stays **scheduled**.
- 2 Cutoff passes. On the next check: status **no_show**, missed_by = **both**.

Final DB status	Doctor sees	Patient sees
no_show / both	Missed - No one joined	Missed - No one joined

Scenario 7 - Clinic visit completed

- 1 Patient comes to the clinic. Doctor clicks **Consult** in the queue.
- 2 This checks the patient in: status **in_session**, both joined_at fields filled.
- 3 Doctor saves the consultation (any time, even after the cutoff) - **completed**.

Final DB status	Doctor sees	Patient sees
completed	In Session, then Completed	Completed

Scenario 8 - Clinic visit, doctor never started the consult

- 1 Doctor never clicks Consult for this clinic appointment. Status stays **scheduled**.
- 2 Cutoff passes - status **no_show**, missed_by = **patient** (a clinic slot nobody started is treated as the patient not coming).

Final DB status	Doctor sees	Patient sees
no_show / patient	Missed - Patient didn't join	Missed - You didn't join

Scenario 9 - Doctor leaves or refreshes before the patient joins

- 1 Doctor joins the call alone, then refreshes / leaves.
- 2 Because the patient never joined, the call is NOT ended - the room stays open.
- 3 Patient can still join; doctor can rejoin. If both join, the flow continues as Scenario 1.

Final DB status	Doctor sees	Patient sees
depends	Checked In	Confirmed (Join)

Scenario 10 - Someone tries to join after the time is over

- 1 Status is still scheduled / checked_in and the cutoff has passed.
- 2 Opening the video marks it Missed immediately and shows: *This appointment was missed - its time slot has ended.*
- 3 If the appointment is already in_session, joining is always allowed (rejoin after a drop).

Final DB status	Doctor sees	Patient sees
no_show	Missed	Missed

Scenario 11 - Consultation without medicines

- 1 In the consultation form the doctor ticks **No prescription needed**. The medicines table is hidden.
- 2 Doctor writes advice / notes and saves - status **completed**. No prescription_items rows are created.
- 3 If the box is not ticked and no medicine is added, saving is blocked with a message asking the doctor to choose.

Final DB status	Doctor sees	Patient sees
completed	Completed	Completed

Scenario 12 - Doctor closes the browser tab instead of leaving the call

- 1 Both joined - status **in_session**. The doctor closes the tab, so the 'call ended' event may not be sent.
- 2 Queue keeps showing **In Session** (not Awaiting Notes). It still never becomes Missed.
- 3 Doctor clicks **Consult** and saves - **completed**.

Final DB status	Doctor sees	Patient sees
completed	In Session, then Completed	In Session, then Completed

Scenario 13 - Appointment cancelled

- 1 Patient or doctor cancels before the consultation (not allowed once completed or missed).
- 2 status **cancelled**, video_status cancelled, cancelled_at and cancellation_reason filled.

Final DB status	Doctor sees	Patient sees
cancelled	Not in queue	Cancelled

6. Known limitations

Limitation	Effect	Possible fix
No background timer	Missed is saved only when a page triggers the check - the missed email can arrive late.	A scheduled job (Supabase pg_cron / cron route) every few minutes.
Server time zone	The cutoff uses the server clock. On a UTC server, IST slots would be marked Missed about 5.5 hours late.	Calculate the cutoff in Asia/Kolkata explicitly.
Queue is per date	An 'Awaiting Notes' appointment from yesterday only shows on yesterday's queue.	A separate 'Pending notes' list across all dates.
'Joined' = page opened	Opening the waiting room counts as arriving, even if the person leaves at once.	Use Jitsi participant events for stricter tracking.
Doctor no-show	No automatic refund or penalty.	Use refund_reason = no_show_doctor when missed_by = practitioner.
